ABOUT THIS GUIDE

This section introduces you to the *REMBRANDT User's Guide*. It includes the following topics:

- *Purpose* on page v
- *Audience* on page v
- *Topics Covered* on page v
- *Text Conventions Used* on page vi

Purpose

This guide provides an overview of REMBRANDT. This book is organized into chapters that parallel REMBRANDT's workflow.

Audience

This guide is designed for researchers who want to perform ad hoc querying and reporting across multiple domains, such as gene expression, chromosomal aberrations and clinical data.

Topics Covered

If you are new to REMBRANDT, read this brief overview, which explains what you will find in each chapter.

- [Chapter 1](#) provides an overview of the REMBRANDT program.
- [Chapter 2](#) provides instructions to start using REMBRANDT.
- [Chapter 3](#) describes how to search by gene keyword and Reporter ID and to create gene expression plots, Kaplan-Meier survival plots, and copy number-based graphs from those search results.
- [Chapter 4](#) describes how to create gene expression, copy number, and clinical queries.
- [Chapter 5](#) extends the basic knowledge of the previous chapters and shows you how to work with class comparisons, hierarchical clustering, and principal component analysis.

- [Chapter 6](#) describes how to view all the results generated from advanced searches and high order analyses.
- [Chapter 7](#) describes how to manage user-defined or study-defined patient ID, gene, and reporters lists.

Text Conventions Used

The following table explains conventions used in this guide. The various typefaces represent interface components, keyboard shortcuts, toolbar buttons, dialog box options, and text that you type.

Convention	Description	Example
Bold	Highlights names of option buttons, check boxes, drop-down menus, menu commands, command buttons, or icons.	Click Search .
URL	Indicates a Web address.	http://domain.com
text in SMALL CAPS	Indicates a keyboard shortcut.	Press ENTER.
text in SMALL CAPS + text in SMALL CAPS	Indicates keys that are pressed simultaneously.	Press SHIFT + CTRL.
<i>Italics</i>	Highlights references to other documents, sections, figures, and tables.	See Figure 4.5.
Italic boldface monospace type	Represents text that you type.	In the New Subset text box, enter <i>Proprietary Proteins</i> .
Note:	Highlights information of particular importance	Note: This concept is used throughout the document.
{ }	Surrounds replaceable items.	Replace {last name, first name} with the Principal Investigator's name.

Table Documentation conventions

CHAPTER

1

ABOUT REMBRANDT 1.5

This chapter introduces you to REMBRANDT and provides an overview of REMBRANDT functions.

Topics in this chapter include:

- [About REMBRANDT](#) on page 1
- [About REMBRANDT Functions](#) on page 2

About REMBRANDT

REMBRANDT (REpository for Molecular BRAin Neoplasia DaTa) is a joint initiative of NIH's National Cancer Institute (NCI) and the National Institute of Neurological Disorders and Stroke (NINDS). REMBRANDT provides a bioinformatics knowledge base framework that leverages data warehousing technology to host and integrate clinical and functional genomics data from clinical trials involving patients suffering from gliomas (tumors).

Researchers can use REMBRANDT to answer questions related to a patient or patient population and view integrated datasets in a variety of contexts. REMBRANDT also includes tools that link data to other annotations, such as cellular pathways, gene ontology terms, and genomic information. Researches can also perform various higher-order analyses on clinical and genomic datasets.

About REMBRANDT Functions

Users can perform a variety of tasks in REMBRANDT. *Table 1.1* describes each REMBRANDT task.

Task	Description
Perform Simple Searches by Gene ID and SNP Probeset ID	Search the database and view the following search results: <ul style="list-style-type: none"> • Gene Expression plots • Kaplan-Meier Survival plots For more information, see Simple Search Overview on page 9)
Perform Advanced Adhoc Queries	Query the database and view search results for the following: <ul style="list-style-type: none"> • Gene Expression analysis • Copy Number Data analysis • Clinical Study analysis For more information, see Advanced Searches Overview on page 29.
Perform High Order Analyses	Run higher order analyses, including class comparisons, hierarchical clustering and principal component analyses. For more information, see High Order Analysis Overview on page 43.
Generate Reports	View Advanced Search and High Order Analysis results. Also download static, archive files for use in BRB-ArrayTools. For more information, see Results Overview on page 51.
Manage Lists	Manage user-defined or study-defined patient identifier, gene, or reporters lists. For more information, see Managing Lists Overview on page 69).

Table 1.1 REMBRANDT user tasks

GETTING STARTED WITH REMBRANDT 1.5

This chapter introduces the REMBRANDT interfaces, navigation, and common features used on REMBRANDT pages.

Topics in this chapter include:

- *Launching REMBRANDT* on page 3
- *Creating a User Account* on page 5
- *Logging In* on page 5
- *Accepting REMBRANDT Provisions* on page 5
- *Welcome to REMBRANDT 1.5* on page 6
- *Getting Help* on page 7
- *Application SupportAppendix*
- *Logging Out* on page 8

Launching REMBRANDT

To launch REMBRANDT, follow these steps:

1. Go to the REMBRANDT portal on the NCICB website:
<http://rembrandt.nci.nih.gov/>
2. Click the **REMBRANDT Application** button located in the lower left-hand blue column (*Figure 2.1*).

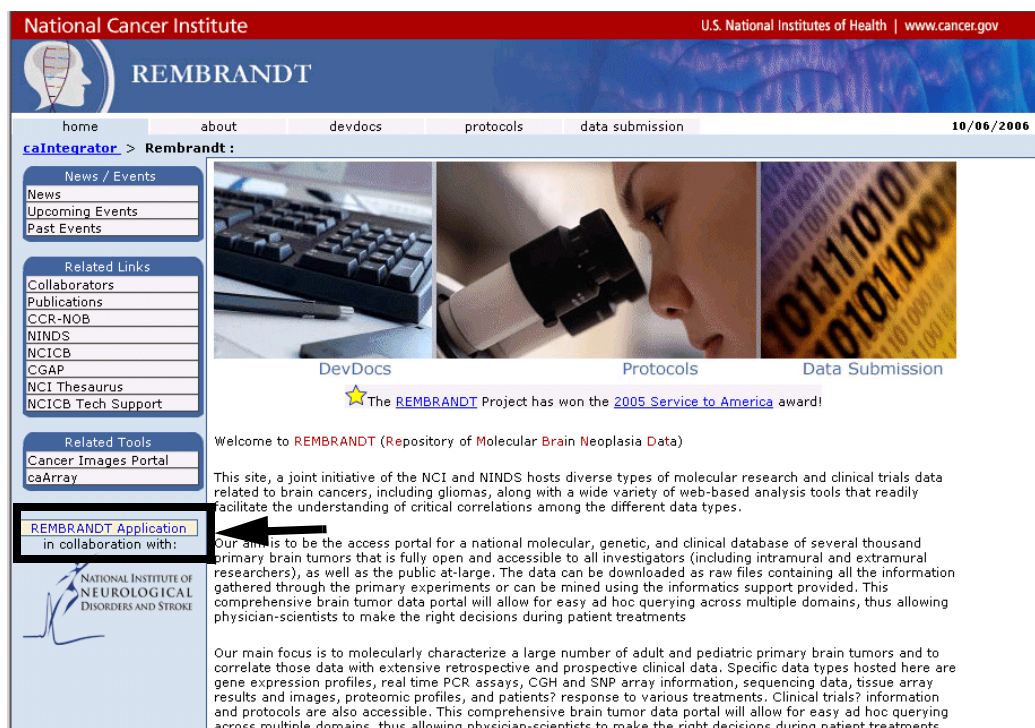

Figure 2.1 The REMBRANDT portal on the NCICB website

The REMBRANDT login page appears (Figure 2.2).

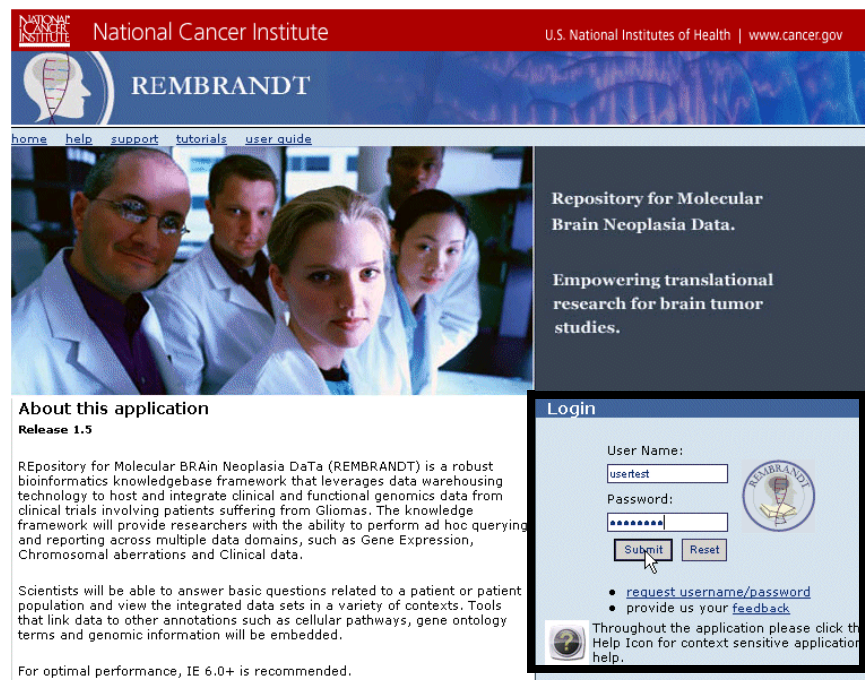

Figure 2.2 REMBRANDT login

Creating a User Account

Each REMBRANDT user is given a unique user name and password. The user name and password you are assigned determines your access rights for the software. To set up a user account, you must:

- Contact NCICB Application Support:
 - NCICB@pop.nci.nih.gov
 - 888-478-4423 (toll-free) or 301-451-4384 (local)

OR

- Go to the NCICB REMBRANDT login page and click the **request username/password** link to send an e-mail requesting a username and password to NCICB Application Support.

Logging In

To log into REMBRANDT, you need your username and password assigned to you by the REMBRANDT Administrator.

1. On the login page, enter your **User Name** and **Password**.

Note: If you would like to offer feedback via e-mail to the REMBRANDT development team, click the **feedback** link.

2. Click the **Submit** button. If your login is successful, the Legal Rules of the Road page appears (*Figure 2.3*).

Accepting REMBRANDT Provisions

Once you log in, the Legal Rules of the Road page appears. After reading the provisions, click the **CLICKING HERE** link (*Figure 2.3*) in the lower right-hand corner.

Figure 2.3 Legal Rules of the Road page

The REMBRANDT workspace appears (*Figure 2.4*).

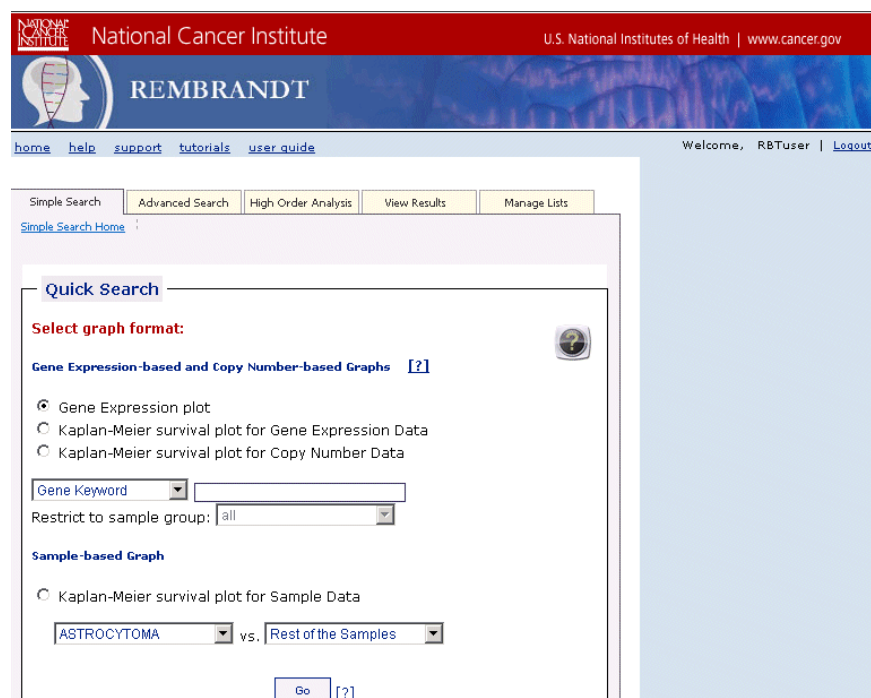

The screenshot shows the REMBRANDT web application interface. At the top is a red header with the National Cancer Institute logo and text: "National Cancer Institute", "U.S. National Institutes of Health | www.cancer.gov", and "REMBRANDT". Below the header is a navigation bar with links: "home", "help", "support", "tutorials", "user guide", and a user status area saying "Welcome, RBTuser | Logout". The main content area has five tabs: "Simple Search", "Advanced Search", "High Order Analysis", "View Results", and "Manage Lists". The "Simple Search" tab is active, showing a "Quick Search" section. It includes a "Select graph format:" label, a link to "Gene Expression-based and Copy Number-based Graphs [?]", and three radio button options: "Gene Expression plot" (selected), "Kaplan-Meier survival plot for Gene Expression Data", and "Kaplan-Meier survival plot for Copy Number Data". Below these are input fields for "Gene Keyword" and "Restrict to sample group:" (set to "all"). A "Sample-based Graph" section has a radio button for "Kaplan-Meier survival plot for Sample Data" and two dropdown menus showing "ASTROCYTOMA" vs. "Rest of the Samples". A "Go" button and a "[?]" link are at the bottom of the search form.

Figure 2.4 The Rembrandt workspace

Welcome to REMBRANDT 1.5

The REMBRANDT workspace comprises a set of five tabs, a blue panel, help links, and a logout link. The five tabs enable you to perform the following functions:

1. Perform a simple search
2. Create a complex queries
3. Perform higher order analyses
4. View results of searches
5. Manage lists

The blue panel may appear blank when you start using REMBRANDT, but once you start using REMBRANDT, information from various functions displays here:

- Queries defined with Advanced Search function
- Any filter settings defined in the High Order Analysis function
- List information managed in Manage Lists function

Getting Help

Information about how to use REMBRANDT is easily accessed from REMBRANDT's menu (*Figure 2.5*) in the top left of the REMBRANDT workspace.

Figure 2.5 REMBRANDT's menu

Table 2.1 describes each item on the REMBRANDT toolbar.

<i>Help</i>	<i>How to Access</i>
Complete online help	To access the complete version of online REMBRANDT help, click the help link located under the REMBRANDT menu. For page-level help, click  on any REMBRANDT page.
Application support	To obtain support for REMBRANDT, click the support link located under the REMBRANDT menu.
Tutorials	To access REMBRANDT tutorials, click the tutorials link located under the REMBRANDT menu.
User's Guide	To access a pdf version of the <i>REMBRANDT User's Guide</i> , click the user guide link located under the REMBRANDT menu.

Table 2.1 Getting help with REMBRANDT

Application Support

You can find additional support at the NCICB Applications Support Web site. To access the site, do the following:

Click the **support** link in the upper right-hand corner. The NCICB Applications Support Group page appears.

Logging Out

To log out of REMBRANDT, follow these steps.

1. On the REMBRANDT workspace, click the **logout** link in the upper right-hand corner.

Figure 2.6 Logout link

The Logout page appears.

Logout

A screenshot of the Logout page. It has a title 'Thank you for visiting the REMBRANDT application' in red. Below it, a message states: 'You cannot save the current session if you are logged in a guest user (RBTuser)'. There are three radio button options: 'Save my current session and logout. [?]', 'Do not save my current session and logout. [?]', and 'Continue working in the application and do not logout.' A 'Submit' button is at the bottom, with a mouse cursor pointing to it.

Figure 2.7 Logout link

Select one of the following options:

- To return to REMBRANDT, select **Continue working in the application and do not logout.**
 - To log out of REMBRANDT *without* saving the session, select **Do not save my current session and logout.**
 - To log out and save your session, select **Save my current session and logout.**
2. Click the **Submit** button.

CHAPTER 3

CONDUCTING A SIMPLE SEARCH

This chapter describes how to use REMBRANDT to conduct simple searches of the REMBRANDT repository and create graphs from the results obtained.

Topics in this chapter include:

- *Simple Search Overview* on page 9
- *Gene Expression Simple Search* on page 10
- *K-M Gene Expression Simple Search* on page 18
- *K-M Copy Number Simple Search* on page 20
- *K-M Sample Search* on page 23
- *Viewing the Clinical Reports* on page 25
- *Viewing Clinical Plots* on page 27

Simple Search Overview

The Simple Search page enables you to perform the following types of searches:

- **Gene Expression search**
- **Kaplan-Meier survival plot** for the following:
 - **Gene Expression Data search**
 - **Copy Number Data search**
 - **Sample Data search**

Results are generated for each search. The Kaplan-Meier survival plots also create Clinical reports and plots.

Gene Expression Simple Search

To create a gene expression plot, follow these steps:

1. From the Simple Search page, select **Gene Keyword**.

Note: If you do not enter a valid gene symbol, the following message appears:
The gene you entered is either invalid, or not in the database. Please select another. Close the message window, and enter another gene symbol.

2. Enter a gene keyword, for example, enter a HUGO gene symbol such as EGFR or WT1, to plot a gene expression profile based on the expression of your gene of interest.
3. Click the **Go** button.

Eliminating Aliases

If a message indicates that one or more genes or their aliases have been found, follow these steps:

1. Select the appropriate option from the drop-down list (*Figure 3.8*).

Figure 3.8 Alias message

To end the search, click **Cancel** button.

2. To continue, click the **Go** button.

Understanding a Gene Expression Plot

When you perform a Gene Expression simple search, by default the **Geometric Mean** Gene Expression Plot (*Figure 3.1*) appears.

Figure 3.1 Gene Expression Plot page (1 of 2)

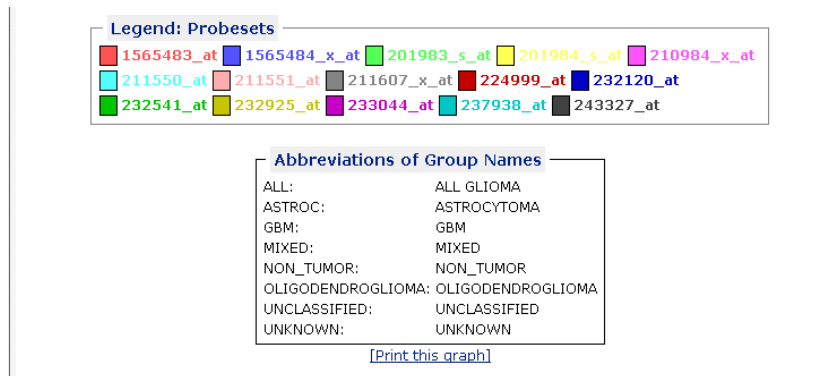

Figure 3.2 Gene Expression Plot page (2 of 2)

Table 3.1 describes each area of the Gene Expression Plot page.

<i>Item</i>	<i>Special Instructions</i>
Data Selection	<p>Select the Affymetrix link to repaint the graph.</p> <p>Select the Unified link to view a unified gene expression with lesser reporters. This displays a gene-based view of the expression data. To obtain the unified gene expression values, the probe-level data is processed with custom CDF (Chip Definition Files) that rearranges Affymetrix probes into gene-based probesets. Probes mapped to alternatively spliced exons are grouped into a distinct probeset. The most 3' probes are selected for processing. Non-specific probes are masked before processing.</p>
Graph Type	<p>Displays different versions of the Gene Expression Plot.</p> <p>Note: If you select the Unified Data Selection type, the Box and Whisker Log2 Intensity Graph Type is not available.</p> <ul style="list-style-type: none"> • Geometric Mean is the default graph shown when you perform a simple search. For additional graph details, see Geometric Mean Plot Details. • Log2 Intensity displays average expression intensities for the gene of interest. For additional graph details, see Log2 Intensity Gene Expression Plot Details. • Box and Whisker Log2 Intensity displays a Box and Whisker plot or box plot. For additional graph details, see Box and Whisker Log2 Intensity Gene Expression Plot Details.
Click here to open plot in a new window	<p>Click the link to open the current graph in a new window and adjust the display. You can then save, print, and e-mail the graph. See Saving, Printing, and E-mailing a Gene Expression Plot.</p>
Legend Probesets	Indicates the color for each probeset appearing in the graph.
Abbreviations of Group Names	Lists the complete name of each group abbreviation in the plot.
Print this Graph	Click to print the graph.

Table 3.1 Understanding the Gene Expression Plot page

Geometric Mean Plot Details

By default, the **Geometric Mean** Gene Expression Plot (*Figure 3.3*) displays when you perform a simple search. The Geometric Mean Gene Expression Plot displays mean expression intensity (Geometric mean) versus Groups.

Figure 3.3 Geometric Mean Gene Expression Plot

Mouse-over a bar on the graph to display Additional Information. *Table 3.2* describes Additional Information details.

Item	Special Instructions
Probeset	Each probeset contains multiple probe pairs. Each probe pair consists of two probes—one called a perfect match (PM) and the other called a mismatch (MM). The perfect match is an oligonucleotide whose sequence exactly matches the gene of interest; the mismatch differs from the perfect match at one base position in the middle of the sequence.
Intensity	The geometric mean value calculated for each comparison group.
p-value	The probability for obtaining the differences in expression values between tumor (or a subtype of tumor) and non-tumor samples.

Table 3.2 Geometric Mean Gene Expression Plot Additional Information

Log2 Intensity Gene Expression Plot Details

The **Log2 Intensity** Gene Expression Plot (*Figure 3.4*) displays average expression intensities for the gene of interest based on Affymetrix GeneChip arrays (U133 Plus 2.0 arrays). Multiple probesets (for some genes) are designed to measure the expression of the gene of interest. For more information on the probeset design strategy for human genes, go to <http://www.affymetrix.com>.

Group average (samples average based on tumor subtypes in six categories, Glioblastoma Multiforme, Oligodendroglioma, Astrocytoma, Mixed, Unclassified, and Unknown tumors) is calculated for each probeset and is plotted on the Y-axis for each tumor type.

Figure 3.4 Log2 Intensity Gene Expression plot

Mouse-over a bar on the graph to display Additional Information. *Table 3.3* describes Additional Information details.

<i>Item</i>	<i>Special Instructions</i>
Probeset	Each probeset contains multiple probe pairs. Each probe pair consists of two probes—one called a perfect match (PM) and the other called a mismatch (MM). The perfect match is an oligonucleotide whose sequence exactly matches the gene of interest; the mismatch differs from the perfect match at one base position in the middle of the sequence.
Intensity	The mean value calculated for each comparison group.
p-value	The probability for obtaining the differences in expression values between tumor (or a subtype of tumor) and non-tumor samples.
Std. Dev.	The standard deviation value of a comparison group, such as GBM or Astrocytoma, for a particular probeset or gene. Standard deviation is a statistical measure of spread or variability.

Table 3.3 Log2 Intensity Gene Expression Plot Additional Information

Box and Whisker Log2 Intensity Gene Expression Plot Details

The **Box and Whisker Log2 Intensity** Gene Expression Plot (*Figure 3.5*) displays a box plot without all the individual data points. A box and whisker plot or box plot is a graph that presents information from a five-number summary. Mouse over one probe-set on the plot to display additional information about the probeset for one group. The following values are listed together and ordered from lowest to highest:

- Most extreme values in the dataset (the maximum and minimum values)
- Lower and upper quartiles
- Median

The following items in the graph indicate the following:

- **Black dot in the box** indicates mean value.
- **Circles** are potential outliers.
- **Triangles** are outliers beyond the graph.

Example uses of box and whisker plots include the following:

- Indicate whether a distribution is skewed and whether there are potential unusual observations (outliers) in the dataset.
- Perform a large number of observations
- Compare two or more datasets.
- Compare distributions because the centre, spread, and overall range are immediately apparent.

Figure 3.5 Box and Whisker Log2 Intensity Gene Expression plot

Mouse-over the bar within the box to display Additional Information. *Table 3.4* describes Additional Information details.

Note: To display a coin plot for the reporter, *click* in the box. A *coin plot* is box-and-whisker plot with all individual data points (see [Displaying a Coin Plot](#)).

<i>Item</i>	<i>Special Instructions</i>
Median	Median value of log 2 (or ratio) gene expression values for particular probeset or unified gene.
Mean	Mean value of log 2 (or ratio) gene expression values for particular probeset or unified gene.
Min.	The minimum value.
Max.	The maximum value.
Q1	The bottom of the box. The first quartile is the median of the lower part of the data.
Q3	The top of the box. The third quartile is the median of the upper part of the data.
...plot	Represents the probeset name.

Table 3.4 Box and Whisker Log2 Intensity Gene Expression Plot Additional Information

Displaying a Coin Plot

A *coin plot* is box-and-whisker plot (Figure 3.6) with all individual data points. This enables you to obtain a diagram representing a statistical summary of the data without the disadvantage of concealing the real data. The following items in the graph indicate the following:

- **Circles** mean potential outliers.
- **Triangles** mean some outliers beyond the graph.

Figure 3.6 Coin Plot for a Probeset

Table 3.5 describes each area of the Gene Expression Coin Plot page.

Item	Special Instructions
Abbreviations of Group Names	Lists the complete name of each group abbreviation in the plot.
Print this Graph	Click to print the graph.

Table 3.5 Understanding the Gene Expression Plot Coin Plot page

Saving, Printing, and E-mailing a Gene Expression Plot

By opening a Gene Expression plot in a new window (Figure 3.7), you can perform a number of tasks with the Gene Expression plot.

Figure 3.7 Displaying a Gene Expression Plot in a new window

Table 3.6 describes the tasks you can perform when you open a Gene Expression plot in a new window.

Icon	Special Instructions
	Mouse-over the graph, and the icon appears in the lower right-hand corner. Click the icon to enlarge or reduce the size of the graph.
	Mouse-over the graph, and standard icons appear in the upper left-hand corner. Click the appropriate icon to save, print, or e-mail the graph.

Table 3.6 A Gene Expression Plot in a new window

K-M Gene Expression Simple Search

To create a Kaplan-Meier survival plot for gene expression data (K-M Gene Expression), follow these steps:

1. From the Simple Search page, select **Create Kaplan-Meier survival plot for Gene Expression Data**.
2. Enter a gene keyword, for example, enter a HUGO gene symbol such as `EGFR` or `WT1` to plot a gene expression profile based on the expression of your gene of interest.

Note: If you do not enter a valid gene symbol, the following message appears:
The gene you entered is either invalid, or not in the database. Please select another. Close the message window, and enter another gene symbol.
3. From the **Restrict to Sample Group** drop-down list, select a saved sample group.
4. Click the **Go** button.

Redrawing the K-M Survival Plot for Gene Expression Data

To redraw a K-M Gene Expression data, follow these steps:

Note: If you restricted the search to a group, **Constrained to group** appears at the top.

1. To dynamically modify the fold change thresholds and redraw the plot, adjust the **Up-Regulated** and **Down-Regulated** values.
2. To visualize the K-M plot for the unified probeset, select a value from the **Reporters** drop-down list (*Figure 3.8*).

The screenshot shows the 'Simple Search' tab selected in the top navigation bar. Below the navigation bar, there is a link for 'Simple Search Home'. The main content area displays 'Constrained to group: ALL GLIOMA' in red text. Below this, there are two rows of controls: 'Up-Regulated' and 'Down-Regulated'. Each row has a threshold value of '2.0' in a text box, followed by a 'Folds' label and a dropdown arrow. To the right of these is a 'Reporters' dropdown menu currently set to 'Default'. Below the 'Down-Regulated' row is a 'Reporter Selection' dropdown menu currently set to 'Affymetrix'. At the bottom of the form is a 'Redraw Graph' button.

Figure 3.8 Redrawing a Kaplan-Meier Gene Expression data

3. Specify a **Unified** or a **Affymetrix Reporter Selection**.
4. Click the **Redraw Graph** button.

Understanding K-M Survival Plot for Gene Expression Data

A K-M Survival Plot for Gene Expression Data (*Figure 3.9*) displays the survival rate at each time point for samples with certain expression characteristics (e.g., EGFR expression levels in tumor samples greater than those in the non-tumor samples by 3 fold or higher). Kaplan-Meier estimates are calculated based on the last follow-up time and the censor status (0=alive, 1=dead) from the samples of interest. The Kaplan-Meier estimates are then plotted against the survival time. The points that correspond to the events with censor status of 0 are indicated on the graph. You can dynamically modify the fold change (up and down regulation) thresholds and redraw the plot.

Figure 3.9 Kaplan-Meier Survival Plot for Gene Expression Data (1 of 2)

powered by
cancerator

Figure 3.10 Kaplan-Meier Survival Plot for Gene Expression Data (2 of 2)

Table 3.7 describes areas on the Kaplan-Meier Survival Plot for Gene Expression data page.

Item	Special Instructions
	Mouse-over the graph, and standard icons appear in the upper left-hand corner. Click the appropriate icon to save, print, or e-mail the graph.
View Clinical Reports	When you apply a gene expression filter, REMBRANDT provides links to display the gene expression for Upregulating Samples , Downregulating Samples , and Intermediate Samples . For more information, see Viewing the Clinical Reports .
Statistical Report	<ul style="list-style-type: none"> • Displays the gene keyword entered as search criteria for the plot. • Displays the reporter selected for the plot. • Number of Samples specifies the number of Up-Regulated, Intermediate, Down-Regulated samples, if any. • Log-rank <i>p</i>-Value indicates the significance of the difference in survival between any two groups of samples segregated based on gene expression of the gene of interest. The log rank <i>p</i>-value is calculated using Mantel-Haenszel procedure. The <i>p</i>-values are recalculated every time a new threshold is selected.

Table 3.7 Kaplan-Meier Survival Plot for Gene Expression Data page

K-M Copy Number Simple Search

To create a Kaplan-Meier survival plot for copy number-based data (KM Copy Number), follow these steps:

1. From the Simple Search page, select **Create Kaplan-Meier survival plot for Copy Number Data**.
2. Enter one type of search criteria:
 - Select **Gene Keyword** and enter a HUGO gene symbol, such as EGFR or WT1, to plot a Kaplan-Meier survival plot based on the expression of your gene of interest.
 - Select **SNP Probe Set ID** and enter an SNP array vendor specific identifier. For example, SNP_A-1650833 is one of the SNP probeset for Affymetrix Human Mapping 100K Set chip.

Note: If you do not enter a valid ID, the following message appears: *The gene you entered is either invalid, or not in the database. Please select another.* Close the message window, and enter another ID.

3. To search on a sample group saved in a previous search, select a group from the **Restrict to Sample Group** list box.
4. Click the **Go** button.

Redrawing the K-M Survival Plot for Copy Number Data

To redraw a KM Copy Number graph, follow these steps:

Note: If you restricted the search to a group, **Constrained to group** appears at the top.

1. Select the amplification and deletion criteria.
2. To visualize the K-M plot for the unified probeset, select a value from the **Reporters** drop-down list (*Figure 3.11*).

The screenshot shows a web interface for a simple search. At the top, there are tabs for 'Simple Search', 'Advanced Search', 'High Order Analysis', 'View Results', and 'Manage Lists'. Below the tabs, a link 'Simple Search Home' is visible. The main content area has a red header 'Constrained to group: ALL GLIOMA'. Below this, there are two rows of criteria: 'Amplified ≥ 2.0 Copies' and 'Deleted ≤ 2.0 Copies'. To the right of these is a 'Reporters' dropdown menu with 'SNP_A-1675151' selected. At the bottom of the criteria section is a 'Redraw Graph' button.

Figure 3.11 Redrawing a Kaplan-Meier Survival Plot for Copy Number data page

3. Click the **Redraw Graph** button.

Understanding K-M Survival Plot for Copy Number Data

A **gene keyword** search displays a plot (*Figure 3.12*) for each SNP probeset for samples with certain amplification/deletion characteristics (e.g., amplification of the cytoband that EGFR maps to 7p11.2). Each SNP probeset is associated with the gene of interest to show the survival rate at each time point. Kaplan-Meier estimates are calculated based on the last follow-up time and the censor status (0=alive, 1=dead) from the samples of interest. The Kaplan-Meier estimates are then plotted against the survival time. The points that correspond to the events with censor status of 0 are indicated on the graph. You can dynamically modify the fold change (up and down regulation) thresholds and redraw the plot.

An **SNP Probeset ID** search displays a plot showing the survival rate at each time point for samples with certain expression characteristics (e.g. EGFR expression levels in tumor samples are greater than those in the non-tumor samples by 3 fold or higher). Kaplan-Meier estimates are calculated based on the last follow-up time and the censor status (0=alive, 1=dead) from the samples of interest. The Kaplan-Meier estimates are then plotted against the survival time. The points that correspond to the events with censor status of 0 are indicated on the graph. You can dynamically modify the fold change (up and down regulation) thresholds and redraw the plot.

Figure 3.12 Kaplan-Meier Survival Plot for Copy Number Data (gene search) (1 of 2)

Figure 3.13 Kaplan-Meier Survival Plot for Copy Number Data (gene search) (2 of 2)

Table 3.8 describes areas on the Copy Number-based Plot page.

Item	Special Instructions
	Mouse-over the graph and standard icons appear in the upper left-hand corner. Click the appropriate icon to save, print, or e-mail the graph.
View Clinical Reports	When you apply a copy number filter, REMBRANDT provides links to display the copy number data for samples. For more information, see Viewing the Clinical Reports .
Statistical Report	<ul style="list-style-type: none"> • Displays the search criteria for the plot. • Displays the reporter selected for the plot. • Number of Samples specifies the number of different types of samples, if any. • Log-rank p-value indicates the significance of the difference in survival between any two groups of samples segregated based on gene expression of the gene of interest. The log rank p-value is calculated using Mantel-Haenszel procedure. The p-values are recalculated every time a new threshold is selected.

Table 3.8 Kaplan-Meier Survival Plot for Copy Number Data (gene keyword search)

K-M Sample Search

To create a Kaplan-Meier survival plot for sample data (K-M Sample), follow these steps:

1. From the **Simple Search** tab, select **Create Kaplan-Meier survival plot for Sample Data**.
2. Select a sample each drop-down list for comparison purposes.
3. Click the **Go** button. The Kaplan-Meier survival plot appears (*Figure 3.14*).

Understanding K-M Survival Plot for Sample Data

A Kaplan-Meier Survival Plot for Sample Data (*Figure 3.14*) shows the survival rate at each time point for samples with certain expression characteristics (e.g. EGFR expression levels in tumor samples are greater than those in the non-tumor samples by 3 fold or higher). Kaplan-Meier estimates are calculated based on the last follow-up time and the censor status (0=alive, 1=dead) from the samples of interest. The Kaplan-Meier estimates are then plotted against the survival time. The points that correspond to the events with censor status of 0 are indicated on the graph. You can dynamically modify the fold change (up and down regulation) thresholds and redraw the plot.

Figure 3.14 Kaplan-Meier Survival Plot Sample Data (1 of 2)

Figure 3.15 Kaplan-Meier Survival Plot for Sample Data (2 of 2)

Table 3.9 describes areas on the Kaplan-Meier Survival Plot for Sample Data page..

Item	Special Instructions
	Mouse-over the graph, and standard icons appear in the upper left-hand corner. Click the appropriate icon to save, print, or e-mail the graph.
View Clinical Reports	To display clinical data for the selected sample groups, click the group link. For more information, see Viewing the Clinical Reports .

Table 3.9 Kaplan-Meier Survival Plot for Sample Data page

Item	Special Instructions
Statistical Report	<ul style="list-style-type: none"> Displays the search criteria for the plot. Displays the reporter selected for the plot. Number of Samples specifies the number of Up-Regulated, Intermediate, Down-Regulated samples, if any. Log-rank p-value indicates the significance of the difference in survival between any two groups of samples segregated based on gene expression of the gene of interest. The log rank p-value is calculated using Mantel-Haenszel procedure. The p-values are recalculated every time a new threshold is selected.

Table 3.9 Kaplan-Meier Survival Plot for Sample Data page

Viewing the Clinical Reports

A Clinical report displays patient demographics, therapy, and outcome data. This information is displayed in a single domain, such as gene expression, or in multiple domains that combine queries, such as gene expression, chromosomal aberrations, and clinical areas (*Figure 3.16*). On the Clinical page, you can select and save samples or show clinical plots of the selected samples.

Note: When either a gene expression filter and/or a copy number filter are applied with the Advanced Search function, hyperlinks are provided in this report to display the gene expression and/or copy number data for a particular sample.

Microsoft Internet Explorer
 Sample List Saved
 OK

Figure 3.19 Saving Selected Samples on the Clinical page

- Click the **Save Selected Samples** button. Sample List Saved appears.
- Click the **OK** button.

Note: If you want to add the saved sample set to an Advanced Search query later, close the Clinical window. For more information, see Step 2 on the Refine Query page (see [Refining a Query](#) on page 41).

5. To show clinical plots for the selected samples, click **Show Clinical Plots for these Samples** at the top of the window (see [Viewing Clinical Plots](#)).
6. To show a Kaplan-Meier Survival Plot for Sample Groups, click View KM Plot (see [K-M Sample Search](#)).

Viewing Clinical Plots

You can display two kinds of clinical plots:

- **Survival vs Age at Dx** (diagnosis in years) indicates the survival or number of months versus the age at diagnoses in years. The data points are colored by disease type.
- **Karnofsky score (Neurological assessment) Vs Age at Dx** (diagnosis in years) indicates the Karnofsky score or neurological assessment versus the age at diagnosis in years. The data points are colored by disease type.

To toggle between the different types of plots, click the **SurvivalvsAgeatDx** link or the **KarnofskyscoreVsAgeatDx** link.

To select the samples of interest, follow these steps:

1. Click and drag a rectangle around the samples to save for future use. A red rectangle appears around the samples, and the list of the samples appears on the right-hand side ([Figure 3.20](#)).

Figure 3.20 Sampling from a Clinical plot

To clear the samples, and select another group, click the **clear samples** link under the **Save Samples** button.

2. To help lasso the points on the plot and identify the location of these points, mouse over a sample name in the list. A yellow circle appears on the plot where the sample is located.
3. To save the selected samples to a file, enter a name for the samples in the text box, and click the **Save Samples** button.

CHAPTER 4

CONDUCTING ADVANCED SEARCHES

This chapter describes how to create complex queries to generate graphs.

Topics in this chapter include:

- [Advanced Searches Overview](#) on page 29
- [Gene Expression Advanced Search](#) on page 30
- [Copy Number Advanced Search](#) on page 35
- [Clinical Study Advanced Search](#) on page 38
- [Managing Advanced Searches](#) on page 40
- [Refining a Query](#) on page 41

Advanced Searches Overview

The Advanced Search function enables you to create multiple searches and then group the searches into a single, complex query from which you can generate reports. The following is an overview of this process.

1. The Advanced Search - Build Query page enables you to define advanced searches from three categories:
 - **Gene Expression Analysis**
 - **Copy Number Analysis**
 - **Clinical Analysis**
2. Once you create a search, the Advanced Search - Build Query page appears. You can add more searches or copy, edit and delete existing searches with the buttons on the blue panel .
3. Once the searches are complete, click the **Finalize Query** button or **Refine Query** option.

4. On the Refine Query page, group the searches with parentheses and AND/OR conditional items to create one complex query.
5. Validate the query and select and run a report. Report results are listed on the View Results page.

Gene Expression Advanced Search

To define an advanced gene expression search, follow these steps:

1. On the Gene Expression page, in the **Query Name** box, you are required to enter a name for the gene expression query. The name must be unique among all the queries in the current session (*Figure 4.1*).

Gene Expression

Simple Search | **Advanced Search** | High Order Analysis | View Results | Manage Lists

2. You are required to enter at least one search criteria for the query. *Table 4.1* lists the available search criteria:

Criteria	Item Name	Special Instructions
Gene	Type Genes	<p>Select a gene identifier option (Name/Symbol, Locus Link ID or GenBank AccNo.).</p> <p>Enter the corresponding comma delimited value or an identifier for the genes to be searched.</p> <p>OR</p> <p>Click the Browse button to upload a text file containing Gene identifiers. The file must have one entry per line and a return at the end of the file.</p>
	Choose a Saved Gene List	Select a gene list created with the REMBRANDT Manage Lists function (see Managing Lists Overview) to further filter the search. If you have not added a gene list, this option is not available.
	All Genes	<p>Click if you do not wish to specify a list of genes but want to display data for all the genes analyzed.</p> <p>You must apply this option to a pre-existing result set, as described in Refining a Query.</p>
Region	Chromosome Number	Select the chromosomal region of interest to search for by specifying a chromosome of interest (1-22, X or Y).
	Cytoband	Lists only the relevant cytobands for a particular chromosome. Select a cytoband range.
	Map Browser	Click to conduct a search of cytoband ranges.
	Base Pair Position (kb)	Enter the start and end base pair positions.
Clone Id/Probe Set ID	Type Clones	<p>Enter or paste a comma-delimited IMAGE Clone ID/ Affymetrix probeset ID list to be searched. IMAGE Clone identifiers must start with IMAGE:.</p> <p>OR</p> <p>Click the Browse button to upload a text file containing identifiers. The file must have one entry per line and a return at the end of the file.</p>
	Choose a Saved Clone List	Select a clone list created with the REMBRANDT Manage Lists function (see Managing Lists Overview) to further filter the search. If you have not added a clone list, this option is not available.
Gene Ontology (GO) Classifications	(list box)	Enter a Gene Ontology (GO) ID in the format GO:##### to search for one or more branches of the GO hierarchy. For example, enter GO:0005006 (epidermal growth factor receptor activity (12)).

Table 4.1 Advanced Gene Expression search criteria instructions

3. Optionally, you can combine a disease type with the query. *Table 4.2* lists the Disease Type items:

Criteria	Item Name	Special Instructions
Disease Type	(list box)	Select a disease. Mouse over the disease type to display the tumor sub-types for the selected disease type.
	Grade	<i>Future Implementation</i>
Sample Identifier	(list boxes)	Enter or paste a comma-delimited sample identifier list to be searched. OR Click the Browse button to upload a text file containing identifiers. The file must have one entry per line and a return at the end of the file.
Fold Change	Up-Regulation Down-Regulation Unchanged	Specify the threshold for the differential regulation. This returns differential expression ratios between tumor and non-tumor samples for a particular reporter. To create an All Genes query, you must select a fold change threshold of 4 or above.
Array Platform	(list box)	Select an array platform.

Table 4.2 Advanced Gene Expression disease type criteria instructions

For the last step, you submit the search. Submitting the search saves the search criteria, and the Advanced Search - Build Query page appears. No results are generated until you create a query from your saved searches.

4. To save the search and return to the Advanced Search tab, click the **Submit** button.

You can also use the other buttons as follows:

- To restore the report to its original state and clear any highlighting, click the **Clear** button.
- To eliminate all data currently entered in the form and not save the search, click the **Cancel** button.
- To display a preview of the report generated by the search results, click the **Preview** button.

Selecting a Gene Ontology (GO) Classification

Once you select the **GO Browser** button on the Gene Expression page, a list of GO IDs appears (*Figure 4.3*).

Figure 4.3 GO ID list

To add the GO ID to your advanced search, click on the appropriate GO term. The GO ID is added to the Gene Expression page.

Selecting a Pathway

To select a pathway of interest, follow these steps.

1. Browse the pathway list, and check the pathways of interest (*Figure 4.4*).

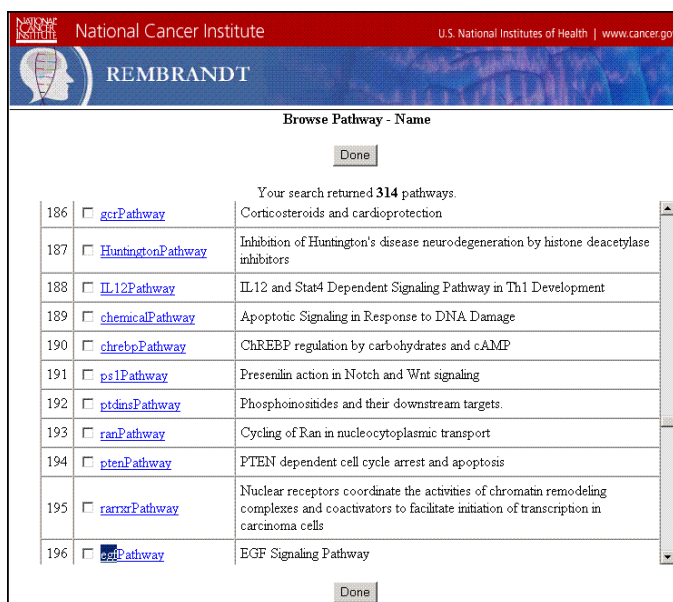

Figure 4.4 caBIO pop-up window

Note: For more information about a pathway, click the pathway name.

- To quickly find the pathway of interest, type CTR-F. The Search dialog box appears (*Figure 4.5*).

Figure 4.5 Search dialog box

- Enter the pathway into the search text box, and click the **Find Next** button. The pathway(s) fulfilling the search criteria appear.
- Select the check box next to the pathway of interest and click the **Done** button. The selected pathways are added to the query.

Copy Number Advanced Search

To add a copy number data analysis to a query, follow these steps:

- On the Copy Number Data page, in the **Query Name** box, you are required to enter a name for the query. The name must be unique among all the queries in the current session (*Figure 4.6*).

Copy Number Data

Figure 4.6 Copy Number Data page (top portion)

2. You are required to enter at least one search criteria for the copy number query. *Table 4.3* lists the available search criteria:

Criteria	Item Name	Special Instructions
Gene	Type Genes	Select a gene identifier option (Name/Symbol , Locus Link ID , or GenBank AccNo.), and then enter the corresponding comma delimited value or identifiers for the genes to be searched.
	Choose a Saved Gene List	Select a gene list created with the REMBRANDT Manage Lists function (see Managing Lists Overview) to further filter the search. If you have not added a gene list, this option is not available.
	All Genes	Click if you do not wish to specify a list of genes but want to display data for all the genes analyzed. You must apply this option to a pre-existing result set, as described in Refining a Query .
Region	Chromosome Number	Select the chromosomal region of interest to search for by specifying a chromosome of interest (1-22, X or Y).
	Cytoband	Lists only the relevant cytobands for a particular chromosome. Select a cytoband range.
	Map Browser	Click to conduct a search of cytoband ranges.
	Base Pair Position (kb)	Enter the start and end base pair positions.
Geonomic Annotation Track	(text box)	<i>Future Implementation</i>
	Geonomic Browser	<i>Future Implementation</i>
SNP Id	Type SNPs	Select an SNP type identifier (dbSNP ID or SNP Probe Set ID). Enter or paste a comma-delimited SNP list to be searched. OR Click the Browse button to upload a text file containing identifiers. The file must have one entry per line and a return at the end of the file.
	Choose a Saved SNP List	Select an SNP list created with the REMBRANDT Manage Lists function (see Managing Lists Overview) to further filter the search. If you have not added a SNP list, this option is not available.
	Validated SNPs	Select one type of Validated SNPs: All , Excluded , Included , or Only .
Allele Frequency	Population Type	<i>Future Implementation</i>

Table 4.3 Advanced Copy Number search criteria instructions

At the bottom of the Advanced Copy Number page, you can add disease type criteria to the search (*Figure 4.2*).

The screenshot shows the 'Advanced Copy Number' search interface. The 'Disease Type' dropdown is open, showing options: ALL, ASTROCYTOMA, GBM, and MIXED. A tooltip for 'MIXED Tumor Sub-types' is displayed, listing: 1. Mixed Glioma, 2. Adult Brain Stem Mixed Glioma, 3. Anaplastic Oligoastrocytoma, 4. Mixed Astrocytoma-Ependymoma, 5. Mixed Astrocytoma-Ependymoma-Oligodendroglioma, and 6. Oligoastrocytoma. Below the dropdown, the 'Grade' is set to 'All'. The 'Sample Identifier' section has a text input field. The 'Copy Number' section has radio buttons for 'Amplified', 'Deleted', and 'Amplified or Deleted', each with a corresponding threshold input field. The 'Assay Platform' dropdown is set to '100K SNP Array'. At the bottom are 'clear', 'cancel', 'preview', and 'submit' buttons.

Figure 4.7 Advanced Copy Number Disease Type

- Optionally, you can combine a disease type with the query. *Table 4.4* lists the Disease Type items:

Criteria	Item Name	Special Instructions
Disease Type	(list box)	Select a disease. Mouse over the disease type to display the tumor sub-types.
	Grade	<i>Future Implementation</i>
Sample Identifier	(list boxes)	Enter or paste a comma-delimited sample identifier list to be searched.
		OR Click the Browse button to upload a text file containing identifiers. The file must have one entry per line and a return at the end of the file.
Copy Number	Amplified Deleted Amplified or Deleted Unchanged	Specify the threshold for the copy number. To create an All Genes query, you must select an amplification threshold greater than 10 or a deletion threshold less than 1.
Array Platform	(list box)	Select the array platform.

Table 4.4 Advanced Copy Number disease type criteria instructions

For the last step, you submit the search. Submitting the search saves the search criteria, and the Advanced Search - Build Query page appears. No results are generated until you create a query from your saved searches.

4. To save the search and return to the Advanced Search tab, click the **Submit** button.

You can also use the other buttons as follows:

- To restore the report to its original state and clear any highlighting, click the **Clear** button.
- To eliminate all data currently entered in the form and not save the search, click the **Cancel** button.
- To display a preview of the report generated by the search results, click the **Preview** button.

Clinical Study Advanced Search

To add a clinical data analysis to a query, follow these steps:

1. On the Clinical Data page, in the **Query Name** box, you are required to enter a name for the query. The name must be unique among all the queries in the current session (*Figure 4.8*).

Clinical Data

The screenshot shows the top portion of the Clinical Data page. At the top, there are tabs: Simple Search, Advanced Search (selected), High Order Analysis, View Results, and Manage Lists. Below the tabs are links: Advanced Search Home and Refine Query. The main form has several fields:

- Query Name * [?]**: A text input field with a placeholder "(should be unique)".
- Disease Type [?]**: A dropdown menu with options: ALL, ASTROCYTOMA, GBM, MIXED. A tooltip is visible for the ASTROCYTOMA selection, titled "ASTROCYTOMA Tumor Sub-types", listing:
 1. Anaplastic Astrocytoma
 2. Brain Astrocytoma
 3. Diffuse Astrocytoma
 4. Intradural Extramedullary Cauda Equina Astrocytoma
 5. Pilocytic Astrocytoma
 6. Pilomyxoid Astrocytoma
 7. Pleomorphic Xanthoastrocytoma
 8. Spinal Cord Astrocytoma
 9. Subependymal Astrocytoma
- Grade: All [?]**: A dropdown menu.
- Sample**: A text input field.
- Occurrence**: A checkbox labeled "First Pre".
- Prior Therapy [?]**: A text input field.

Below the Disease Type dropdown, there is a note: "Mouseover disease types and any relevant sub-type will be displayed".

Figure 4.8 Clinical Data page (top portion)

2. You must specify a disease type, and optionally complete the remaining information. *Table 4.5* lists the Disease Type items:

Criteria	Item Name	Special Instructions
Disease Type	(list box)	Select a disease. Mouse over the disease type to display the tumor sub-types for the selected disease type.
	Grade	<i>Future Implementation</i>
Sample Identifier	(list box)click	Enter or paste a comma-delimited sample identifier list to be searched. OR Click the Browse button to upload a text file containing identifiers. The file must have one entry per line and a return at the end of the file.
Occurrence	First Presentation Recurrence	<i>Future Implementation</i>
Prior Therapy	Radiation Radiation Type	Select Radiation and then select the type of radiation that the patient received prior to enrollment in the current study.
	Chemo Agent	Select Chemo and then select the agent that the patient received prior to enrollment in the current study.
	Surgery Title Outcome	Select Surgery and then enter the name of the surgery that the patient had prior to enrollment in the current study and the outcome of the surgery.
Onstudy Therapy	Radiation Radiation Type	Select Radiation and then select the type of radiation that the patient received after enrollment in the current study.
	Chemo Agent	Select Chemo and then select the agent that the patient received after enrollment in the current study.
	Surgery Title Outcome	Select Surgery and then enter the name of the surgery that the patient had after enrollment in the current study and the outcome of the surgery
Survival Range	Lower Upper	Specify the upper and lower limits (in months) for filtering the clinical data based on the age (in years) at which a patient was diagnosed.
Age at Dx	Lower Upper	Specify the upper and lower limits for filtering the clinical data based on the age at which a patient was diagnosed with the disease.
Gender		Select the appropriate gender of the patient.
Race		Select the appropriate race of the patient.
Clinical Evaluation	Karnofsky	Score from the Karnofsky Performance status scale, representing the functional capabilities of a person.
	Lansky	Score from an enumerated set of values representing performance status according to the Lansky scale. The Lansky scale is intended for use only with subjects under 12 years old.

Table 4.5 Advanced Clinical Data criteria instructions

Criteria	Item Name	Special Instructions
	Neuro Exam	The participant's neurologic exam score. Score identifiers are the following: +2 DEFINITELY BETTER +1 POSSIBLY BETTER 0 STABLE -1 POSSIBLY WORSE -2 DEFINITELY WORSE
	MRI	Relates to the disease evaluation as measured by scan (MRI/CT). Score definitions are the following: +3 DISAPPEARANCE OF TUMOR (CR) +2 DEFINITELY BETTER (PR) +1 POSSIBLY BETTER 0 UNCHANGED -1 POSSIBLY WORSE -2 DEFINITELY WORSE (PD) -3 DEVELOPMENT OF A NEW LESION (PD)

Table 4.5 Advanced Clinical Data criteria instructions

For the last step, you submit the search. Submitting the search saves the search criteria, and the Advanced Search - Build Query appears. No results are generated until you create a query from your saved searches.

- To save the search and return to the Advanced Search - Build Query, click the **Submit** button.

You can also use the other buttons as follows:

- To restore the report to its original state and clear any highlighting, click the **Clear** button.
- To eliminate all data currently entered in the form and not save the search, click the **Cancel** button.
- To display a preview of the report generated by the search results, click the **Preview** button.

Managing Advanced Searches

Once you submit an advanced search, you are returned to the Advanced Search - Build Query page. Your search is added to the counter next to the appropriate Advanced Search button. You can perform one of the following tasks:

- Add more searches: Click the **Gene Expression Analysis**, **Copy Number Analysis**, or **Clinical Analysis** button.
- Copy, edit, or delete existing searches. Click the **Finalize Query** button or the **Refine Query** option under the Advanced Search tab, and see [Refining a Query](#).
- Create a complex query from the submitted advanced searches. Click the **Finalize Query** button or the **Refine Query** option under the Advanced Search tab, and see [Refining a Query](#).

Refining a Query

The Refine Query page enables you to group multiple searches into a single, complex query. You must validate the query to generate a result.

Note: The blue panel on the right side displays any previously-defined advanced searches. Using the **Copy**, **Edit**, and **Delete** buttons, you can add, modify, or remove existing searches.

1. Fill in the Refine Query criteria (*Figure 4.9*).

Step 1: Refine your result set

Please refine your results by grouping the queries

Group Your Queries			
(Query Name)	and/or
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Please select an "All Genes" query

Step 2: Select Result set (mandatory for "All Genes" queries)

Select Result set to apply the above Query:

Step 3: Validate your query

Step 4: Please select a View

Step 5: Please select data source

NIH NEURO-ONCOLOGY BRANCH

Figure 4.9 Refine Query page

Table 4.6 lists the Refine Query items:

<i>Item Name</i>	<i>Special Instructions</i>
Step 1. Refine your result set	<p>You can group the queries to obtain a particular result set, or select all queries.</p> <p>To group queries click Please refine your results by grouping queries.</p> <ul style="list-style-type: none"> • Select the open parentheses, (. • Select a Query Name. • Select a closing parentheses). • Select an and/or operator at the end of a query row to enable the next row where you can select another query of interest. • Repeat for each query name to be grouped. Go to Step 3. <p>OR</p> <p>To select all queries, click Please select an All Genes query. The drop-down list appears from which you can choose an All Genes query. Go to Step 2.</p>
Step 2. Select result set (mandatory for “All Genes” queries)	Select a previously saved result set to which to apply these queries. You will not see any result sets if you have not saved a sample set from a previous query. To ensure that the list is current, click the Refresh button.
Step 3. Validate your query	You must click to validate that the number of parentheses added to the query grouping and the name of your query appears.
Step 4. Select a view	Select a report from the drop-down list. The available reports vary based type of queries selected.
Step 5. Select a data source	<p>Select a datasource to filter the query by the institute providing data. You can select more than one institute. The NIH Neuro oncology branch is the public dataset.</p> <p>Note: The Simple Search function and Preview assigns all the institutes to which you have access.</p>

Table 4.6 Refining Query instructions

To return to the Advanced Search - Build Query page, click the << **Back** button.

2. To generate a report from the defined criteria, click the **Run Report >>** button.

Note: If the **Run Report** button does not appear, click the **Validate Query** button first to check the syntax of your query.

CHAPTER 5

HIGH ORDER ANALYSIS

This chapter describes how to use REMBRANDT to run higher order analyses, including class comparisons, hierarchical clustering, and principal component analyses.

Topics in this chapter include:

- [High Order Analysis Overview](#) on page 43
- [Performing a Class Comparison](#) on page 44
- [Performing a Principal Component Analysis](#) on page 46
- [Performing Hierarchical Clustering Analysis](#) on page 48

High Order Analysis Overview

REMBRANDT stores preprocessed gene expression data (filtering and normalization). Click one of the following buttons on the High Order Analysis page to further analyze gene expression data.

- **Class Comparison Analysis**
- **Principal Component Analysis (PCA)**
- **Heiarchical Clustering Analysis**

The blue panel displays the filter settings selected for you analysis. A high order analysis generates results that you can review on the View Results page.

Performing a Class Comparison

To create a High Order Analysis with Class Comparisons, follow these steps:

1. The Class Comparison Analysis Form page (*Figure 5.1*) enables you to define the criteria to perform a class comparison.

Note: Clicking the plus (+) sign in Step 2 expands and displays the Advanced Statistic options.

Class Comparison Analysis Form

Criteria	Item Name	Special Instructions
Step 1. Select Group	Show all samples	Select to show all samples.
	Select samples	Select to specify the groups to include in the sample.
	<ul style="list-style-type: none"> Existing Groups Selected Groups 	Select at least two groups in the Existing Groups box and move them to the Selected Groups box.
Step 2. Filter Genes/ Reporters	View Filter Settings	To use the default filter settings, continue to Step 3.
	+ (-)	Click to access (and close) the advanced options.
	<ul style="list-style-type: none"> Constrain reporters by variance (Gene Vector) percentile: % 	Enter a percentage which selects the reporters whose variances of the log ratio (or Log2 signals) across all experiments were among the top percentile of variance of all reports identified. For example, 70% chooses reporters with the top 30 (100 - 70) percentile of variance.
	<ul style="list-style-type: none"> Use differentially expressed genes 	Select saved differentially expressed genes identified by class comparison. Choose an option (gene list1 or gene list2) or click the Upload link to upload a file.
	<ul style="list-style-type: none"> Use differentially expressed reporters 	Select saved differentially expressed reporters identified by class comparison. Choose an option (reporter list1 or reporter list2) or click the Upload link to upload a file.
	<ul style="list-style-type: none"> Set These Filters as Default 	Click to save the options as default filter settings.
Step 3. Select Array Platform	Select Array Platform	Select the array platform.

Table 5.2 Principal Comparison Analysis criteria instructions

3. You must enter a title/name for this analysis in the **Name Analysis Result** text box. This name must be unique among all your queries in this session.
4. To submit your criteria and create a Principal Comparison Analysis report, click the **Submit** button.

Performing Hierarchical Clustering Analysis

To create a High Order Analysis with Hierarchical Clustering, follow these steps:

1. The Hierarchical Clustering Analysis Form (*Figure 5.3*) enables you to perform a clustering.

Hierarchical Clustering Analysis Form

The screenshot shows a web interface for the Hierarchical Clustering Analysis Form. At the top, there are five tabs: Simple Search, Advanced Search, High Order Analysis (which is selected), View Results, and Manage Lists. Below the tabs is a link for Analysis Home. The form is divided into five steps, each with a red header and a blue link for help. Step 1: Filter Genes/Reporters [?] includes a 'View Filter Settings' link with a plus icon. Step 2: Select Statistic [?] includes dropdowns for Distance Matrix (set to Correlation) and Linkage Method (set to Average). Step 3: Cluster By [?] includes radio buttons for Samples (selected) and Genes. Step 4: Select Array Platform [?] includes a dropdown for Oligo (Affymetrix). Step 5: Name Analysis Result * [?] includes a text input field with a note '(should be unique)'.

Figure 5.3 Selecting Hierarchical Clustering criteria

2. You are required to enter at least one step for the hierarchical clustering. Table 5.3 lists the available criteria:

Criteria	Item Name	Special Instructions
Step 1. Filter Genes/ Reports	View Filter Settings	To use the default filter settings, continue to Step 3.
	+ (-)	Click to access (and close) the advanced options.
	<ul style="list-style-type: none">Constrain reporters by variance (Gene Vector) percentile: %	Enter a percentage which selects the reporters whose variances of the log ratio (or Log2 signals) across all experiments were among the top percentile of variance of all reports identified. For example, 70% chooses reporters with the top 30 (100 - 70) percentile of variance.
	<ul style="list-style-type: none">Use differentially expressed genes	Select saved differentially expressed genes identified by class comparison. Choose an option (gene list1 or gene list2) or click the Upload link to upload a file.
	<ul style="list-style-type: none">Use differentially expressed reporters	Select saved differentially expressed reporters identified by class comparison. Choose an option (reporter list1 or reporter list2) or click the Upload link to upload a file.

Table 5.3 Hierarchical Clustering criteria instructions

Criteria	Item Name	Special Instructions
	<ul style="list-style-type: none"> Set These Filters as Default 	Click to save the options as default filter settings.
Step 2. Select Statistic	Distance Matrix	Select a distance matrix option: <ul style="list-style-type: none"> Pearson correlation measures the relative shape of the gene regulations rather than the absolute levels. This is a natural choice, because it is widely used to measure gene correlations. Euclidean distance is the most common distance measure. It measures the absolute level of gene regulation.
	Linkage Method	Select a linkage option to affect the shape of the resulting clusters: <ul style="list-style-type: none"> Average linkage is the average of all pair-wise distances between members of the two clusters. Single linkage is the minimum distance between two clusters. Complete linkage is the maximum distance between two clusters.
Step 3. Cluster By	Cluster by	Leave the default to cluster on Samples or cluster by Genes .
Step 4. Select Array	Select Array Platform	Select the array platform.

Table 5.3 Hierarchical Clustering criteria instructions

- You must enter a title/name for this analysis in the **Name Analysis Result** text box. This name must be unique among all your queries in this session.
- To submit your criteria and create a Hierarchical Clustering Analysis report, click the **Submit** button.

CHAPTER 6

VIEWING RESULTS

This chapter describes reports and search results that REMBRANDT returns after advanced searches and high order analyses. You can also download the product BRB Array Tools and the static BRB-ArrayTools archive files.

Topics in this chapter include the following:

- [Results Overview](#) on page 51
- [Advanced Search or Query Results](#) on page 51
- [High Order Analysis Results](#) on page 60
- [Downloading BRB Array Tools and Files](#) on page 66

Results Overview

The View Results page shows a collection of reports previously viewed in a particular user session. This allows you to compare reports by opening them in separate windows. For example, you can compare clinical and gene expression reports with a set of patient samples. You can view results generated with the Advanced Search function and the High Order Analysis function .

The View Results page also enables you to download BRB Array tools and the static archive files for use in BRB-ArrayTools.

Advanced Search or Query Results

The following Advanced Search reports are generated:

- [Gene Expression Sample Report](#)
- [Gene Expression Disease Report](#)
- [Copy Number Sample Report](#)

For more information, see the following:

- *Filtering Results by Gene or Reporter (Filter Toolbar)*
- *Highlighting Results By Value (Highlight Toolbar)*
- *Selecting and Saving Sample Results (Select Samples Toolbar)*
- *Differentiating Data (Show All Values Toolbar)*
- *Removing Columns (Hide Diseases toolbar)*
- *Showing Additional Information*

Filtering Results by Gene or Reporter (Filter Toolbar)

To filter a report, follow these steps:

1. From the **Filter** toolbar (*Figure 6.3*), select the filter mode **Show only** or **Hide**.
2. Select **Gene** or **Reporter** from the drop-down list, and enter gene or reporter to be filtered.

For example, if you click **Show Only**, select **Gene**, and enter WT1, only WT1 samples appear in the list.

3. Click the **Filter** button.

The results are filtered based on your selections (*Figure 6.3*).

The screenshot shows the REMBRANDT Gene Expression Sample interface. The Filter toolbar is highlighted with a red box. It includes a dropdown menu for 'Filter' (set to 'Show Only'), a dropdown for 'Gene(s)' (set to 'WT1'), and a 'Filter' button. Below the toolbar, the 'ASTROCYTOMA Samples' table is displayed, showing two rows of data for WT1. The table has columns for Gene, Reporter, and various sample IDs (E09137, E09214, E09262, HF0017, HF0026, HF0189, HF0223, HF0224). The bottom of the interface shows the query details for Gene Expression Query 1 and Gene Expression Query 2.

Gene	Reporter	ASTROCYTOMA Samples
WT1	206067 s at	0.6000 1.0900 0.8100 0.3600 1.1600 2.2600 1.9500 1.6200
WT1	216953 s at	0.2600 0.5200 0.7200 0.9200 1.8300 1.7400 2.7100 1.9500

Figure 6.3 Filter toolbar

4. To show all of the samples again, click the **Reset (show all)** button.

Note: You can use more than one toolbar to limit the samples shown in the results. For example, you can filter the results and then highlight certain filtered results.

Highlighting Results By Value (Highlight Toolbar)

To highlight certain data, follow these steps:

1. From the **Highlight** toolbar, select an operator and a threshold value. (Figure 6.4).

For example, select **< 5** to highlight all values less than 5.

2. Click the **Highlight** button.

The values that meet this criteria are highlighted in yellow (Figure 6.4).

The screenshot shows the REMBRANDT Gene Expression Sample interface. The 'Highlight' toolbar is highlighted with a black box, showing the 'highlight values' dropdown set to '<' and the threshold '1'. The 'Highlight' button is also highlighted. Below the toolbar, the 'ASTROCYTOMA Samples' table is displayed. The table has columns for Gene, Reporter, and various sample IDs (E09137, E09214, E09262, HF0017, HF0026, HF0189, HF0223, HF0). The values for WT1 and WT1 are highlighted in yellow, indicating they meet the criteria of being less than 1.

Gene	Reporter	E09137	E09214	E09262	HF0017	HF0026	HF0189	HF0223	HF0
WT1	206067 s at	0.6000	1.0900	0.8100	0.3600	1.1600	2.2600	1.9500	1.6200
WT1	216953 s at	0.2600	0.5200	0.7200	0.9200	1.8300	1.7400	2.7100	1.9500

Figure 6.4 Highlight toolbar

3. To restore the report to its original state and clear the highlighting, click the **Clear Highlighting** button.

Note: You can use more than one toolbar to limit the samples shown in the results. For example, you can filter the results and then highlight certain filtered results.

Selecting and Saving Sample Results (Select Samples Toolbar)

To save samples for use with an additional query, follow these steps:

1. On the sample report, there are several ways to select samples.
 - To select all the listed samples on the **Select Samples** toolbar, click the **Check All** link. To deselect all the listed samples, click the **Uncheck All** link (Figure 6.5 below).

The screenshot shows the REMBRANDT Gene Expression Sample interface. The 'Select Samples' toolbar is highlighted with a black box, showing the 'Check All' and 'Uncheck All' links. The interface includes a filter section, a highlight section, and a table of sample results.

Gene	Reporter	ASTROCYTOMA Samples	E09137	E09214	E09262	HF0017	HF0026	HF0189	HF0223	HF0
WT1	206067 s at	0.6000	1.0900	0.8100	0.3600	1.1600	2.2600	1.9500	1.6200	
WT1	216953 s at	0.2600	0.5200	0.7200	0.9200	1.8300	1.7400	2.7100	1.9500	

Figure 6.5 Selecting samples from the Select Samples toolbar

- To select (or deselect) all the samples in a sample group, click the box next to the sample group name, for example the box next to **ASTROCYTOMA Samples**. All the samples in the group are selected (Figure 6.6 below).
- To select (or deselect) an individual sample within a group, click the box in the column next to the sample name.

The screenshot shows a close-up of the 'ASTROCYTOMA Samples' group. A black box highlights the selection checkboxes for individual samples. The 'E09262' checkbox is being clicked by a mouse cursor.

Gene	Reporter	ASTROCYTOMA Samples	E09137	E09214	E09262	HF0017
WT1	206067 s at	0.6000	1.0900	0.8100	0.3600	
WT1	216953 s at	0.2600	0.5200	0.7200	0.9200	

Figure 6.6 Selecting samples from the results

Once you create a sample set, you can save the selected samples to a file and later add the saved sample set to a query (*Figure 6.7*).

Figure 6.7 Saving the samples

2. Enter a unique name for the sample set. Once saved, this name will appear on the Refine Query page, in the **Select the Result set to apply the above query** drop-down list. This enables you to add the saved sample set to another query.
3. Click the **Save Samples** button.

The samples are saved to on the Clinical window. For more information, see [Viewing the Clinical Reports](#).

Differentiating Data (Show All Values Toolbar)

1. To differentiate between missing values in the array and data that did not meet your search criteria, click **Show All Values on this Report** on the **Show all Values** toolbar (*Figure 6.8*).

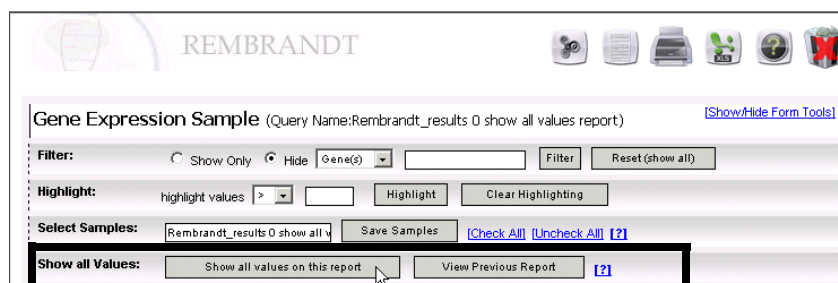

Figure 6.8 Show All Values toolbar

The samples that did not meet your criteria, appear in gray. A value of **Null** indicates a missing value for that reporter.

2. To display the previous report before you clicked the **Show All Values on this Report** button, click the **View Previous Report** button.

Removing Columns (Hide Diseases toolbar)

To remove a disease from the report, select the check box for the disease in the **Hide Diseases** toolbar (Figure 6.9). The checked disease is NOT included in the results.

The screenshot shows the REMBRANDT web interface. At the top, there's a header with the REMBRANDT logo and several icons. Below that, a section titled 'Gene Expression Sample' (Query Name: Rembrandt_results 0 show all values report) contains various controls. A 'Filter' section has radio buttons for 'Show Only' and 'Hide', a 'Gene(s)' input field, and 'Filter' and 'Reset (show all)' buttons. A 'Highlight' section has a 'highlight values' dropdown, an input field, and 'Highlight' and 'Clear Highlighting' buttons. A 'Select Samples' section has a dropdown menu, a 'Save Samples' button, and links for '[Check All]', '[Uncheck All]', and '[?]'. A 'Show all Values' section has a 'Show all values on this report' button, a 'View Previous Report' button, and a '[?]'. The 'Hide Diseases' section is highlighted with a black box and contains checkboxes for 'ASTROCYTOMA', 'GBM', 'MIXED', 'OLIGODENDROGLIOMA', 'UNCLASSIFIED', and 'UNKNOWN'. Below this, a 'Displaying:' section shows '1 - 17 of 17 records', '25 per page', and '91 samples returned'. The main table has columns for 'Gene', 'Reporter', and sample names under 'MIXED Samples' and 'UNKNOWN Samples'. The first three rows of data are visible, showing gene names like EGFR and reporter names like 1565483_at.

Figure 6.9 Hide Diseases toolbar

Showing Additional Information

When results are listed in a report, row or column items may appear as links. These links may be for genes, reporters, cytobands, or sample names. Click the link to display additional information about the item.

For example, to display more information about a gene, click the gene name link (Figure 6.10).

Gene	Reporter
EGFR	1565483_at
EGFR	1565484_x_at

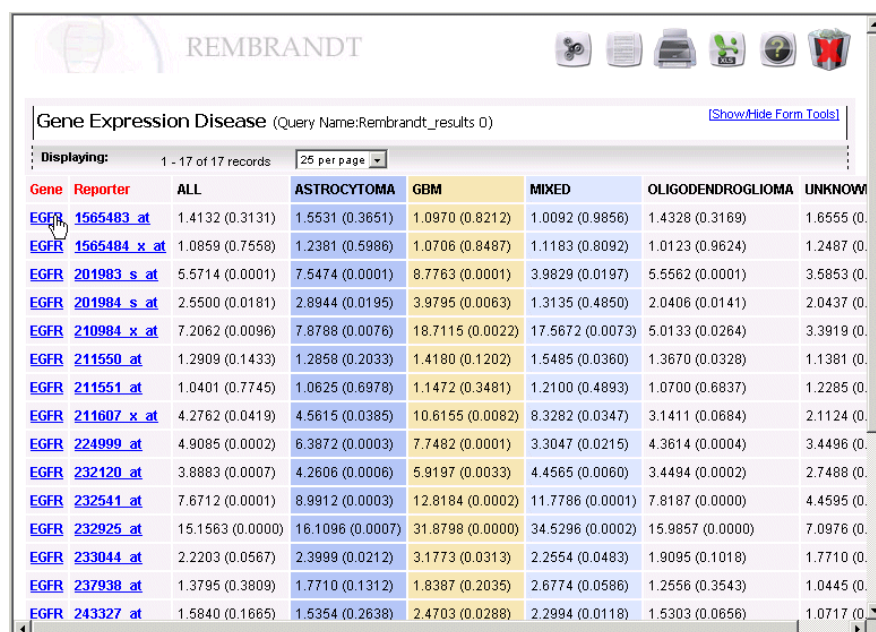

Figure 6.10 The Gene column

The Cancer Genome Anatomy Project (CGAP) browser opens.

Gene Expression Disease Report

The Gene Expression Data Per Disease Group report (*Figure 6.11*) displays the geometric mean of the gene expression (between the tumor group and the average of non-tumor samples) for each probeset (or IMAGE clone). Each column represents a sample group (tumor sub-type). Group average samples were based on tumor subtype categories.

Group average samples are also calculated for each probeset (or IMAGE clone). To indicate probabilities of obtaining the differences in expression values between tumor (or a sub-type of tumor) and non-tumor samples, a *p*-value is displayed within the parenthesis for each geometric value (or ratio).

Gene	Reporter	ALL	ASTROCYTOMA	GBM	MIXED	OLIGODENDROGLIOMA	UNKNOWN

Figure 6.11 Gene Express Data Per Disease Group report

To show additional information about the resulting gene or reporter, see [Showing Additional Information](#).

Copy Number Sample Report

The Copy Number Data Per Sample report displays the copy number data from Affymetrix 100K SNP arrays. The CHP files from the Affymetrix Gene Chip Operating System were processed using the Affymetrix GDAS (GeneChip® DNA Analysis Software). Copy number data was collected for each mapping SNP reporter on the Chip, for all the tumor samples. Each column represents a sample, and the samples are grouped based on the tumor sub-type (*Figure 6.12*).

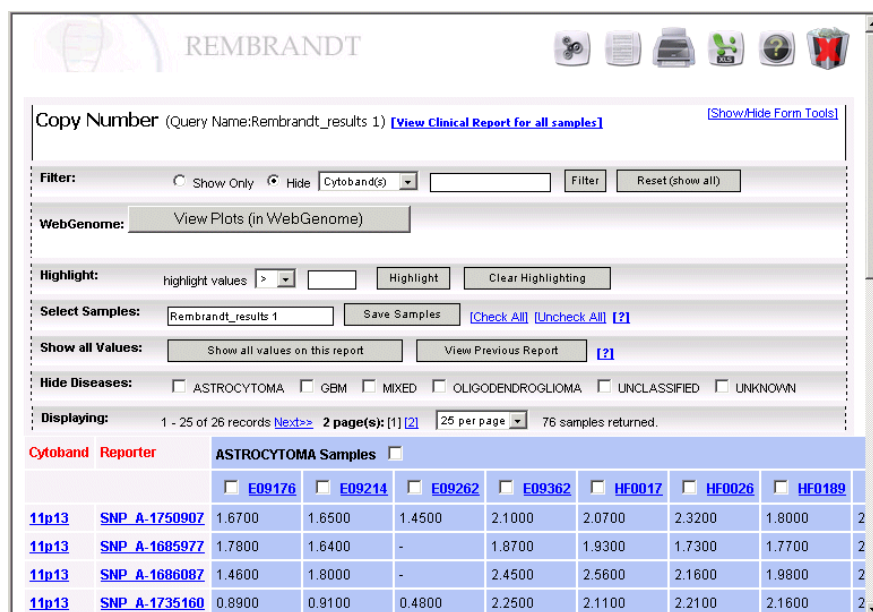

Figure 6.12 Copy Number Data for Sample report

For more information, see to the following:

Displaying Copy Number Sample Data in webGenome

You can display the Copy Number for Data Sample report data as a graphic in the application webGenome. webGenome is a web-based application for plotting and visualizing microarray data, especially comparative genome hybridization (CGH) data. In webGenome, you can select microarray datasets from public, as well as private, database areas. You can also perform preliminary filtering, smoothing, and normalization of data prior to plotting. The system supports several types of plots:

- Scatter Plots plot DNA copy number measurements across the genome, chromosome, or chromosomal interval.
- Annotation Plots show DNA copy number measurements in relation to annotated genome feature, such as genes.
- Annotation Reports show annotation genome features in a tabular format.
- Ideogram Plots show chromosomal amplifications and deletions in relation to cytogenetic chromosome ideograms.
- Probe Plots show measured copy number for selected reporter probes.

Click the **View Plots in webGenome** button (*Figure 6.13*).

		Gene Expression Data Per Disease Group View

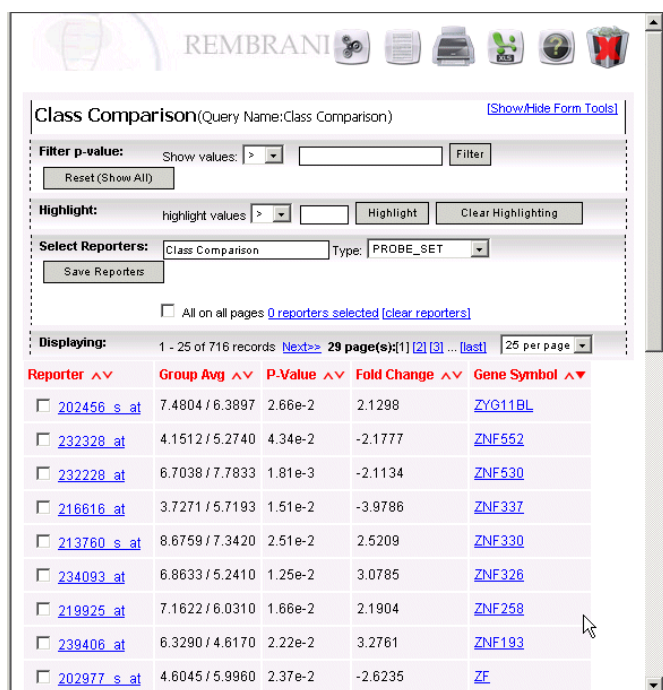

Figure 6.14 Query Results

Class Comparison Report

The Class Comparison report ([Figure 6.15](#)) displays group average, fold change, and *p*-value based on the Advanced Search parameters that you selected. The output varies based on the statistical method chosen.

For a **T-test** or **Wilcox** Statistical Method analysis ([Figure 6.15](#)), the Class Comparison report is as follows.

- The report displays the group average, where the numerator is the mean of log(base 2) expression signals from the samples in the first group. The denominator is the mean of log(base 2) expression signals from the samples in the second group.
- The fold change for the reporter between the selected groups appears along with *p*-value.
- Gene symbol annotations appear for each reporter. To obtain extensive annotations, click the Excel icon on the upper right-hand corner of the report.

Reporter	Group Avg	P-Value	Fold Change	Gene Symbol

- [Highlighting Results By Value \(Highlight Toolbar\)](#)
- [Selecting and Saving Reporters \(Select Reporters toolbar\)](#)
- [Resorting Column Results](#)
- [Showing Additional Information](#)

Filtering a p-value (Filter p-value Toolbar)

To filter a p-value, follow these steps:

1. From the **Filter p-value** toolbar, select an operator from **Show Values** and enter a threshold value.
2. Click the **Filter** button.

The results are filtered based on your selections (*Figure 6.17*).

- To show all of the samples again, click the **Reset (show all)** button.

Note: You can use more than one toolbar to limit the samples shown in the results. For example, you can filter the results and then highlight certain filtered results.

Selecting and Saving Reporters (Select Reporters toolbar)

To select reporters, follow these steps (*Figure 6.18*):

- There are several ways to select reporters in the result list:
 - From the **Select Reporters** toolbar, select a reporter type from the **Type** drop-down list. The reporters with the selected criteria are displayed.
 - To select all of the results, click the **All on all pages** box.
 - To select one row of results at a time, click the box on the left side of the result row.

Figure 6.18 Selecting Reporters instructions

To clear the selected reporters, click the **clear reporters** link.

- To save the selected reporters, enter a unique name for the reporter file next to **Select Reporters**, or maintain the current name, which varies based on the type of Statistical Method selected for the analysis.
- Click the **Save Reporters** button.
The results are saved.
- Click the **OK** button.

Note: You can use more than one toolbar to limit the samples shown in the results. For example, you can filter the results and then highlight certain filtered results.

Resorting Column Results

To sort a column in a report, follow these steps:

- If a report column has red triangles pointing up and down next to the name, you can sort a column of numeric or alphabetical values (Figure 6.19).

Fold Change ▲▼
-8.1624
-6.7058
-5.6246
-5.3892
-5.3799
-5.1293
-4.8571

Figure 6.19 Sorting column results

- To sort a column in ascending order, select the red triangle pointing up. To sort a column in descending order, select the red triangle pointing down.

Principal Component Analysis Plot

The Principal Component Analysis plot (*Figure 6.20*) is a two-dimensional graph which plots the various principal components from the analyses. You can click on the three tabs at the top of the graph to display the following:

- PC1 versus PC2
- PC1 versus PC3
- PC2 versus PC3

Each point on the graph represents a sample. By default, the samples are colored by **Disease Type**. To color by gender, click the **Gender** link or **Remove Colors and Shapes**.

At the bottom of the graph, there is a legend defining how the different shapes on the graph indicate different survival ranges for patients.

To view clinical data for the selected sample, click the **view the clinical data** link (see *Viewing Clinical Plots*).

Figure 6.20 Principal Component Analysis report

Hierarchical Clustering Report

The Hierarchical Clustering report (*Figure 6.21*) displays the dendrogram from the hierarchical clustering analysis. To display the image at full resolution, click on **full size** at the top left-hand corner of the graph. Based on the cluster parameter that you select, the report displays either sample or reporter annotations beneath the dendrogram.

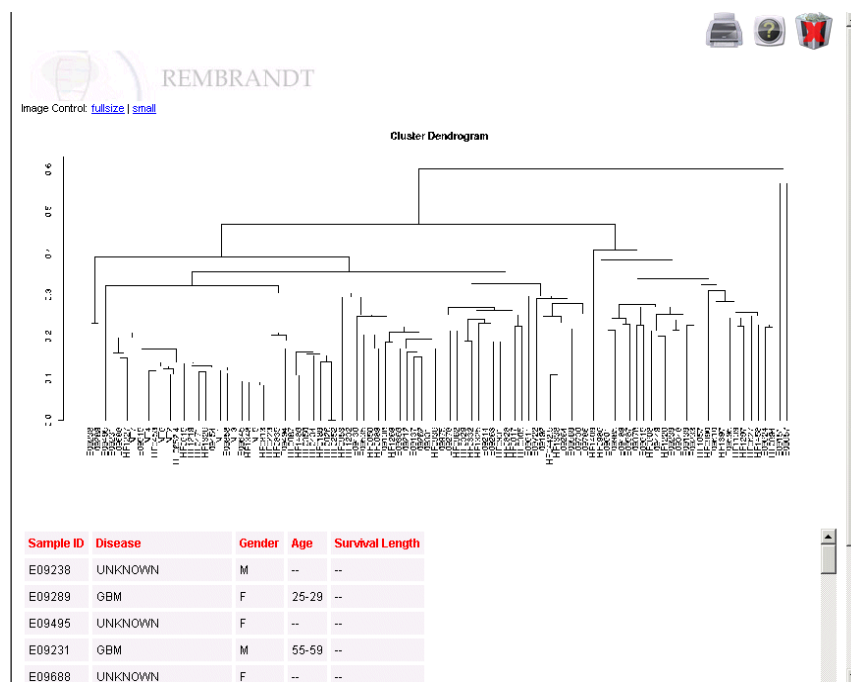

Figure 6.21 Hierarchical Clustering report

Downloading BRB Array Tools and Files

REMBRANDT enables you to analyze data using BRB-ArrayTools created by the Biometric Research Branch of the National Cancer Institute. BRB-ArrayTools is a comprehensive state-of-the-art statistical analysis system for microarray gene expression data. It is free for non-commercial purposes and can be licensed for commercial purposes from the NIH. BRB-ArrayTools installs as an Excel plug-in using a self-installer.

The Bulk Downloads drop-down list box enables you to download the static BRB archive files which enable you to obtain the appropriate files based on your *user role* as follows:

- *Public users* receive the Public dataset file (Rembrandt-Brain-Public-Project.zip)
- *Institution users* receive the institution data and public dataset files.
- *Super users* receive all dataset files.

To download BRB-Array Tools and the appropriate files, follow these steps.

1. To download BRB-ArrayTools, click the **BRB_Array Tools** link.

Figure 6.22 Downloading BRB Array Tools

The web site appears. Download the appropriate version of the product, and follow the prompts.

2. Once you have downloaded and installed BRB-Array Tools, select the files to download to analyze a dataset with BRB-Array Tools.
3. Click the **Download** button.
4. Unzip the REMBRANDT static BRB archive file(s).
5. Open the project worksheet in Excel on a Microsoft Windows PC.

CHAPTER 7

MANAGING LISTS

This chapter describes how to manage lists by editing existing lists, adding new lists or creating new custom lists from existing lists.

Topics in this chapter include:

- *Managing Lists Overview* on page 69
- *Viewing the Data Items in a List* on page 70
- *Removing Data Items to Create a New List* on page 70
- *Deleting an Entire List* on page 72
- *Adding a New “Custom” List* on page 72
- *Combining Existing Lists to Create a New List* on page 71

Managing Lists Overview

The REMBRANDT Manage Lists function centralizes all activities pertaining to the creation and management of user-defined, as well as study-defined, **PatientDID Lists**, **Gene Lists**, and **Reporters Lists**. With these lists, you can further refine queries or facilitate analysis.

Note: You can add a saved gene or IMAGE clone list to an advanced gene expression search. You can also add a saved gene list or probeset list to an advanced copy number search.

The blue panel displays each list type and the associated lists. You can mouse-over a list and display the data items. Using the Manage List function, you can perform the following functions:

- View data items in a list
- Create new lists from existing lists
- Delete lists
- Add lists by uploading them or typing them

Viewing the Data Items in a List

To view the individual data items on a list, follow these steps:

1. At the top of the Manage List page, click on the type of lists you would like to view (**PatientDID Lists**, **Gene Lists**, **Report Lists**).

Rembrandt Manage Lists

Figure 7.1 List types and Details

2. Find a list to be viewed, and click the **details** icon to display all of the items in the list.

Note: You can also mouse-over the list name in the blue panel and the list's data item names appear.

Removing Data Items to Create a New List

You may delete items from an existing list, then view the new list or save the list on your computer. Follow these steps:

1. At the top of the Manage List page, click on the type of lists you would like to view (**PatientDID List**, **Gene List**, **Report List**).
2. Find the list you want to change, and click on the box next to the list name.
3. Click the **details** icon to display all the items in the selected list.

Figure 7.2 Deleting data items

4. Click the **delete** link beside the item you want to delete. The item is removed from the list.

Once you remove the items, you can view the new list or save the list to your computer.

5. Click the **export link** at the bottom of the items list to open and view the new list or save the list on your computer. Click **Open** or **Save**.

Combining Existing Lists to Create a New List

You may create new lists from existing lists. To create a custom list from existing lists, follow these steps:

1. At the top of the Manage List page, click on the type of list you would like to view (**PatientID List**, **Gene List**, **Report List**). The categories for the list appear.
2. Find the category for the new list, and click the box next to the category name. Click more than one box to select multiple categories.

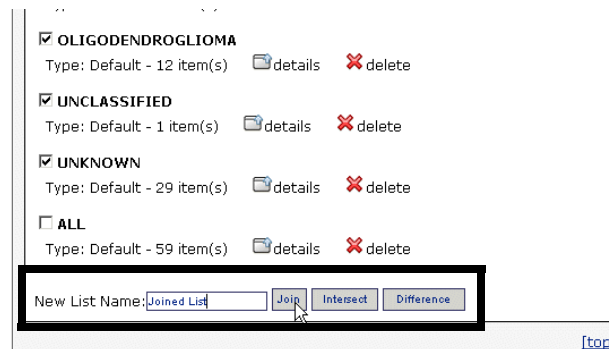

Figure 7.3 Combining existing lists

3. Enter a unique name for the new list you are creating, and then click the appropriate button:
 - **Join** combines two or more categories into a new list.
 - **Intersect** creates a new list from only the items that appear on more than one selected list category.
 - **Difference** creates a new list from items that appear only in one selected list category.

The new list appears in the blue panel in red.

Deleting an Entire List

To delete one or more lists from a list type, follow these steps:

1. At the top of the Manage List page, click on the type of lists you would like to view (**PatientDID List, Gene List, Report List**).
2. Find the list you want to delete, and click the box next to the list name. Click more than one box to select multiple lists for deletion.

Figure 7.4 Deleting an entire list

3. To delete the selected lists, click an **x delete** icon. The selected categories are removed.

Adding a New “Custom” List

You may add a new list type by *uploading* a list from your computer or *manually creating* a list. To add a new list, follow these steps:

1. At the top of the Manage List page, click **Add List**.
The **Upload List or Manually type List** block appears.
2. To upload a list, follow these steps:
 1. Click **Upload List** at the top of the box.

Figure 7.5 Uploading a list

2. From the **Choose the list type** drop-down list box, select the list to be uploaded.
3. Click the **Browse** button beside the **Upload file** box. Navigate to and select the file on your computer that you would like to upload.
4. Enter a unique name for the list, and then click the **Add List** button. The new list appears on the blue panel in red.

3. To create and add a list manually, follow these steps:
 1. Click **Manually Type List** at the top of the box.

— [Upload List](#) -or- [Manually type List](#) —

Choose the list type: Reporter-DBSNP [?]

Type Ids:
(one per line)

Name list:

Figure 7.6 Manually typing a list

2. From the **Choose the list type** drop-down list box, select the list to be uploaded.
3. In the **Type Ids** box, enter items into the text block by typing them one to a line.
4. Enter a unique name for the list, and then click the **Add List** button. The new list appears on the blue panel in red.
5. To open and view the newly created list or save it to your computer, click on the list name in the blue panel. Click **Open** or **Save**.
6. To open and view the newly created list or save it to your computer, click on the list name in the blue panel. Click **Open** or **Save**.

GLOSSARY

Acronyms and other terms referred to in the chapters of this User's Guide are described in this glossary.

Term	Definition
allele	Mutually exclusive alternative forms of the same gene occupying the same locus on homologous chromosomes, differing in DNA sequence and governing the same biochemical and developmental process.
anaplastic	Cancer cells that divide rapidly and have little or no resemblance to normal cells.
Astrocytic tumors	Neoplasms of the brain and spinal cord derived from glial cells.
Benjamini-Hochberg Multiple Testing Correction	The concept of False Discovery Rate (FDR) was introduced in multiple testing by Benjamini and Hochberg (1995).
CCR	Center of Cancer Research
CCR-NOB	CCR Neuro-Oncology Branch
CGAP	Cancer Genome Anatomy Project
Class Comparison	Differential gene expression across the tumor types will be evaluated by calculating the typical t -statistic for each reporter. Both parametric and non-parametric p -value will be computed.
ependymoma	A type of brain tumor that may arise in the ventricles of the brain or in the spinal cord. Also called an ependymal tumor.
False Discovery Rate (FDR)	The expected proportion of Type I errors among rejected hypotheses in simultaneous testing of multiple null hypotheses.
Family-wise Error Rate (FWER)	Denotes the probability of having at least one false significant test result within the set of tested hypotheses.

Table 8.1 Glossary of REMBRANDT terms

Term	Definition
fibrillary astrocytoma	Most frequent histological variant of Diffuse Astrocytoma; predominantly composed of fibrillary neoplastic astrocytes.
gemistocytic astrocytoma	Rare variant of Diffuse Astrocytoma. It is characterized by the presence of a conspicuous, though variable, fraction of gemistocytic neoplastic astrocytes.
Gene Ontology (GO) Classification	The Gene Ontology (GO) project is a collaborative effort to address the need for consistent descriptions of gene products in different databases. The goal of the Gene Ontology project is to produce a controlled vocabulary that can be applied to all organisms even as knowledge of gene and protein roles in cells is accumulating and changing. GO provides three structured networks of defined terms, molecular function, biological process, and cellular component, to describe gene product attributes. (from http://www.geneontology.org)
Glioblastoma	Malignant form of astrocytoma histologically characterized by pleomorphism of cells, nuclear atypia, microhemorrhage, and necrosis.
Gliomas	Any of the largest group of primary tumors of the brain, composed of malignant glial cells. Kinds of gliomas are astrocytoma, ependymoma, glioblastoma multiforme, medulloblastoma, and oligodendroglioma.
Hierarchical Clustering	Hierarchical cluster analysis is a statistical method for finding relatively homogeneous clusters of cases based on measured characteristics. It starts with each case in a separate cluster and then combines the clusters sequentially, reducing the number of clusters at each step until only one cluster is left.
High Order Analysis	After data preprocessing (filtering and normalization), further statistical analysis of gene expression data are performed, including class comparison, class discovery and class prediction.

Table 8.1 Glossary of REMBRANDT terms

Term	Definition
HUGO [gene symbol] [Human Genome Organisation]	HUGO is an international organization of scientists involved in human genetics. Established in 1989 by a collection of the world's leading human geneticists, the primary ethos of the Human Genome Organisation is to promote and sustain international collaboration in the field of human genetics.
Kaplan-Maier	The Kaplan Maier method is used for survival analysis. Kaplan-Maier curves are used to estimate survival probability as a function of time, and survival differences are analyzed by the log-rank test.
Karnofsky Performance Status	A standard way of measuring the ability of cancer patients to perform ordinary tasks. The scores range from 0 to 100, with a higher score indicating a better ability to carry out daily activities. KPS may be used to determine a patient's prognosis, to measure changes in functioning, or to decide if a patient could be included in a clinical trial.
Lansky Play-Performance Status	The play-performance scale for children is a parent-rated instrument which records usual play activity as the index of performance. It is similar to the Karnofsky Performance Scale for adults.
Mann-Whitney Test	A nonparametric test (distribution-free) used to compare two independent groups of sampled data. Unlike the parametric <i>t</i> -test, this non-parametric makes no assumptions about the distribution of the data (e.g., normality).
Multiple Comparison Adjustment	Since tens of thousands of genes are compared, many genes can be false positives. However, genes are not all independent and genes in the same pathway could have similar <i>t</i> -statistics or <i>p</i> -values. Multiple-comparison adjusted <i>p</i> -values have been proposed to handle the multiple comparison issues in the context of microarray data.
myxopapillary ependymoma	Slow growing gliomas which generally occur in young adults and arise almost exclusively in the conus-cauda-filum terminale region. It generally has a favorable prognosis and is characterized histologically by tumor cells arranged in a papillary manner around vascularized mucoid stromal cores.

Table 8.1 Glossary of REMBRANDT terms

Term	Definition
NCI	National Cancer Institute
NCICB	National Cancer Institute Center for Bioinformatics
NINDS	National Institute of Neurological Disorders and Stroke
Oligodendroglial Tumor; Oligodendroglioma	Rare, slow growing tumor that begins in the oligodendrocytes (brain cells that provide support and nourishment for nerve cells). Also called an oligodendroglioma.
pleomorphic xanthoastrocytoma	Astrocytic tumor with a relatively favorable prognosis (WHO grade II) and is typically encountered in children and young adults. It has a superficial location in the cerebral hemispheres and involvement of the meninges.
Principal Component Analysis	PCA is commonly used in microarray research as a tool. It is designed to capture the variance in a dataset in terms of principle components. In effect, one is trying to reduce the dimensionality of the data to summarize the most important (i.e. defining) parts while simultaneously filtering out noise.
protoplasmic [astrocytoma]	Rare variant of Diffuse Astrocytoma. It is predominantly composed of neoplastic astrocytes showing a small cell body with few, flaccid processes with a low content of glial filaments and scant GFAP expression.
SNP	Single nucleotide polymorphisms or SNPs (pronounced “snips”) are DNA sequence variations that occur when a single nucleotide (A,T,C or G) in the genome sequence is altered.
subependymal giant cell astrocytoma;	Benign, slowly growing tumor (WHO grade I) typically arising in the wall of the lateral ventricles and composed of large ganglioid astrocytes. It is the most common CNS neoplasm in patients with Tuberous Sclerosis Complex and typically occurs during the first two decades of life.
Wilcoxin Test	Nonparametric statistics for testing hypotheses about whether two samples differ.

Table 8.1 Glossary of REMBRANDT terms
